

Getting started with the X-NUCLEO-IHM07M1 motor driver expansion board based on the L6230 for STM32 Nucleo

Introduction

The X-NUCLEO-IHM07M1 is a three-phase brushless DC motor driver expansion board based on the L6230 for STM32 Nucleo. It provides an affordable and easy-to-use solution for driving three-phase brushless DC motors in your STM32 Nucleo project. The X-NUCLEO-IHM07M1 is compatible with the ST morpho connector and supports the addition of other boards which can be stacked onto a single STM32 Nucleo board. The user can also mount the Arduino UNO R3 connector. The X-NUCLEO-IHM07M1 is fully configurable and ready to support different closed loop control based on sensor or sensorless mode control, and it is compatible with three shunt or single shunt current sense measuring. The driver used on this STM32 Nucleo expansion board is the L6230, a DMOS fully-integrated driver for three-phase brushless PMSM motors, assembled in a PowerSO36 package, with overcurrent and thermal protection. This user manual describes the procedure to configure the X-NUCLEO-IHM07M1 expansion board to operate with an STM32 Nucleo board.

1 System introduction

1.1 Main characteristics

The list below provides the board specification data and the main parameters for the X-NUCLEO-IHM07M1 expansion board:

- Three-phase driver board for BLDC/PMSM motors
- Nominal operating voltage range from 8 V to 48 V DC
- 2.8 A output peak current (1.4 A_{RMS})
- Operating frequency up to 100 kHz
- Non dissipative overcurrent detection and protection
- Cross-conduction protection
- Thermal measuring and overheating protection
- Full compatibility with ST Six Step or ST FOC control algorithms
- Full support for sensor and sensorless mode
- 3-shunt and 1-shunt configurable jumpers for motor current sensing
- Hall/Encoder motor sensor connector and circuit
- Debug connector for DAC, GPIOs, etc.
- Potentiometer available for speed regulation
- Fully populated board conception with test points
- User LED
- Compatible with STM32 Nucleo boards
- Equipped with ST morpho connectors
- RoHS compliant
- PCB type and size:
 - PCB material: FR-4
 - 4-layer layout
 - Copper thickness: 70 µm (external layer), 35 µm (internal layer)
 - Total dimensions of the board: 70 mm x 66 mm

1.2 Target applications

- Low voltage PMSM motor driver
- Low power fans
- Power tools
- Industrial drives

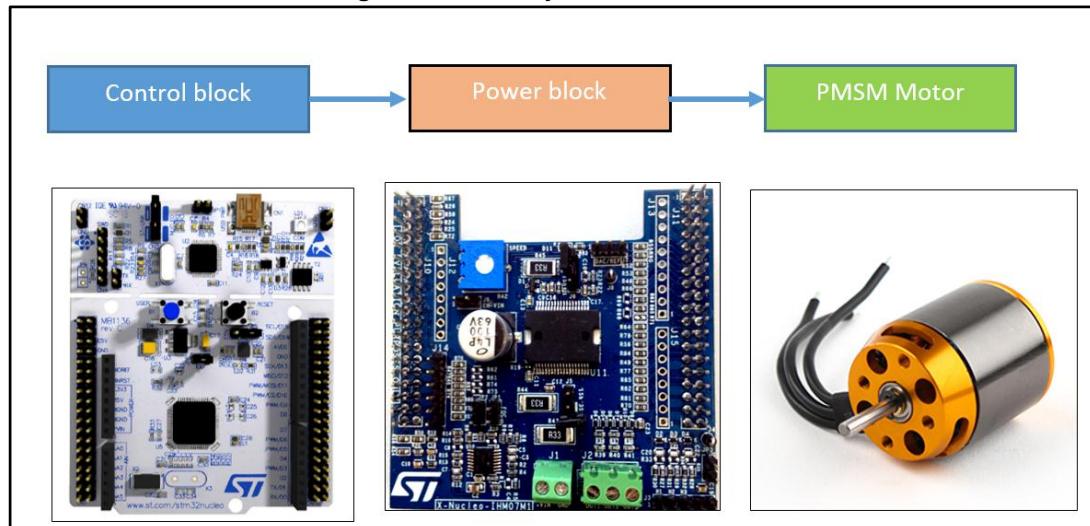

2 Getting started

2.1 System architecture

A generic motor control system can be schematized in three main blocks (see [Figure 2: "Overall system architecture"](#)):

- **Control block** - its main task is to accept user commands and drive a motor. The X-NUCLEO-IHM07M1 is based on the STM32 Nucleo board, which provides all digital signals to properly implement motor driver control.
- **Power block** - it is based on three-phase inverter topology. The core of the power block is the L6230 driver, which contains all the necessary active power and analog components to perform low voltage PMSM motor control.
- **Motor** - the X-NUCLEO-IHM07M1 is able to properly drive a low voltage BLDC/PMSM motor.

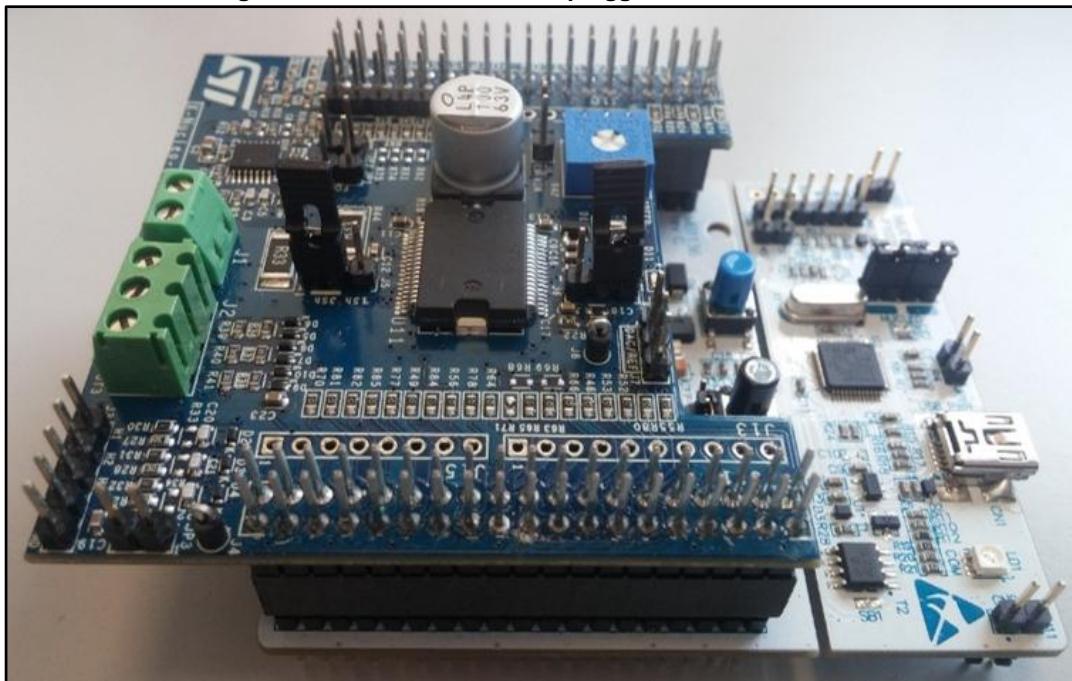

Figure 2: Overall system architecture

2.2 Building the system

The X-NUCLEO-IHM07M1 expansion board is a complete hardware development platform (Power block) for the STM32 Nucleo board, for evaluating a motor control solution for a single BLDC/PMSM motor. For normal board operation, it must be connected to an STM32 Nucleo board (Control block) through the ST morpho connector, as shown in the image below.

Figure 3: X-NUCLEO-IHM07M1 plugged on STM32 Nucleo

The interconnection between the STM32 Nucleo and the X-NUCLEO-IHM07M1 has been designed for full-compatibility with many STM32 Nucleo boards and no solder bridge modification is required. When stacked, the system is ready to operate with the connection of a BLDC/PMSM motor. For proper use, please respect the hardware and software settings. For the software details, refer to the X-CUBE-SPN7 software expansion documents available on www.st.com.

2.2.1 Hardware settings

Table 1: Jumper settings

Jumper	Permitted configurations	Default condition
JP1	Selection for pull-up insertion (BIAS) in current sensing circuit	OPEN
JP2	Selection for op amp gain modification in current sensing circuit	OPEN
JP3	Selection for pull-up enabling in Hall/Encoder detection circuit	CLOSED
J9	Selection to supply the STM32 Nucleo board through the X-NUCLEO-IHM07M ⁽¹⁾	OPEN
J5	Selection for single/three shunt configuration. Set to single shunt by default	2-3 CLOSED
J6	Selection for single/three shunt configuration. Set to single shunt by default	2-3 CLOSED
J7	Debug connector for DAC. Available for probe connection	OPEN

Notes:

⁽¹⁾It is recommended to REMOVE jumper J9 before power-on on J1

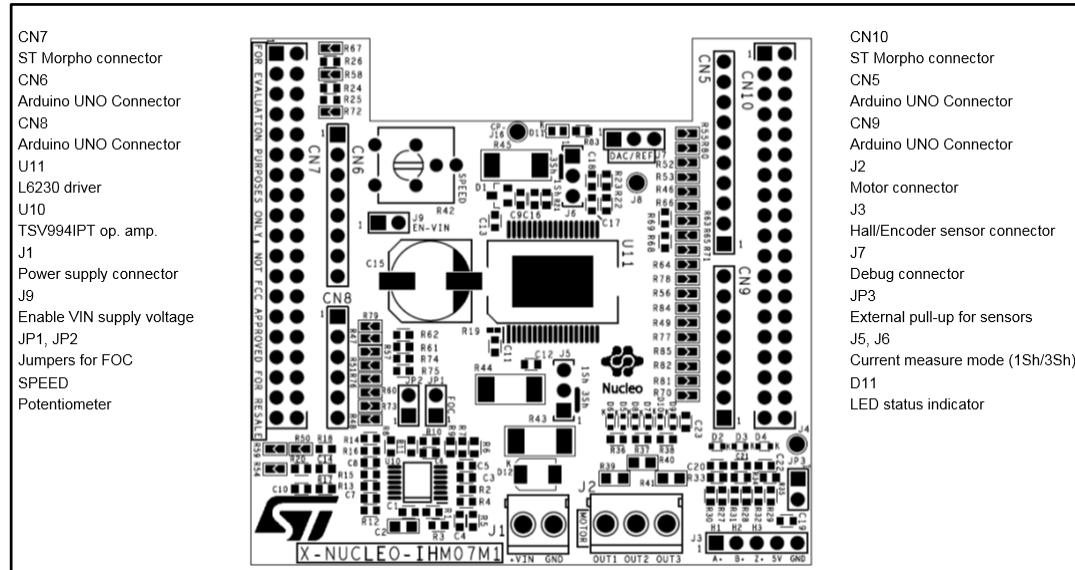

With J9 closed, it is mandatory not to exceed 12 V DC on the J1 connector to avoid damage to the STM32 Nucleo board.

Jumper JP5 (STM32 Nucleo board) MUST be connected between pin 2 and 3 to enable the STM32 Nucleo external power supply.

Table 2: Screw terminal table

Screw terminal	Function
J1	Motor power supply input (8 V- 48 V DC)
J2	3-phase motor connector

Figure 4: X-NUCLEO-IHM07M1 – top layer with silk-screen

The X-NUCLEO-IHM07M1 expansion board is equipped with the ST morpho connector, male pin headers (CN7 and CN10) accessible on both sides of the board. They can be used to connect the power board to the STM32 Nucleo board. All signals and power pins of the MCU are available on the ST morpho connector. For further details, please refer to user manual UM1724 (5.12 STMicroelectronics morpho connector) available on www.st.com.

4 Circuit description

4.1 Power section – L6230 driver with integrated three-phase bridge

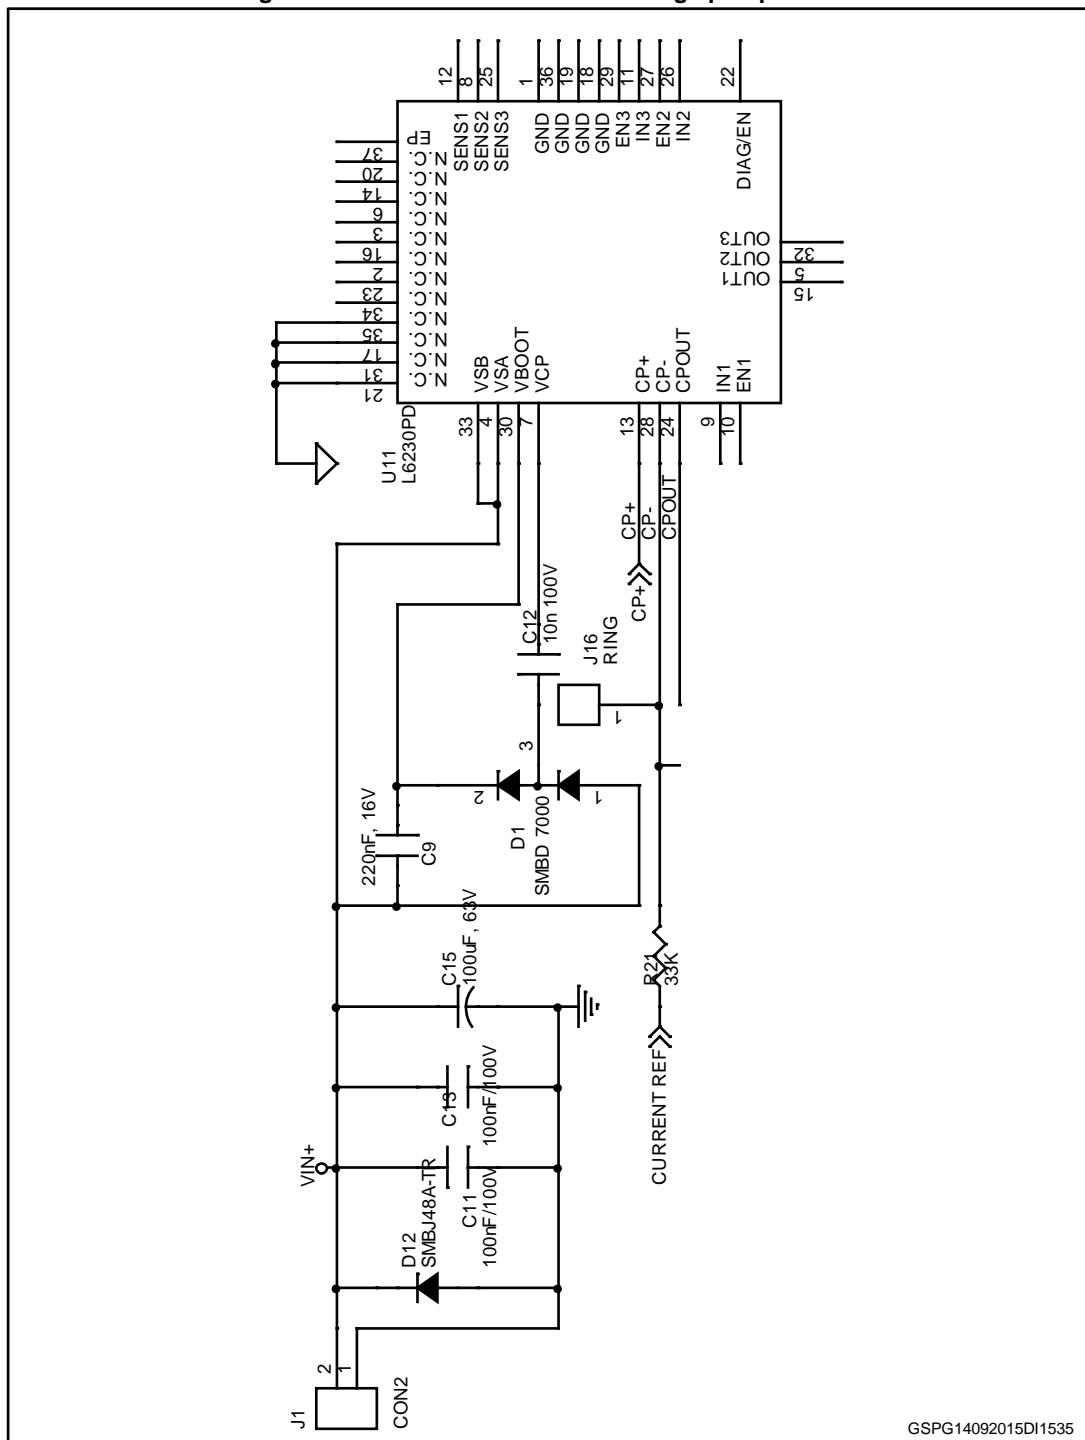

The main section is based on the L6230. It is a DMOS fully-configurable driver for three-phase brushless BLDC/PMSM motors. The supply voltage is provided through an external connector (J1) and with (J9) jumper settings, it is possible to choose if the digital section (STM32 Nucleo board) must be supplied by USB or by the expansion board. For these settings, please refer to [Table 1: "Jumper settings"](#).

Figure 13: X-NUCLEO-IHM07M1 – power section

The L6230 integrates a three-phase bridge which consists of six power MOSFETs. Using the N-channel power MOSFET for the upper transistors in the bridge requires a gate drive voltage above the power supply voltage. The bootstrapped supply (VBOOT) is obtained through an internal oscillator and a few external components to implement a charge pump circuit as shown in the diagram that follows.

Figure 14: X-NUCLEO-IHM07M1 – charge pump circuit

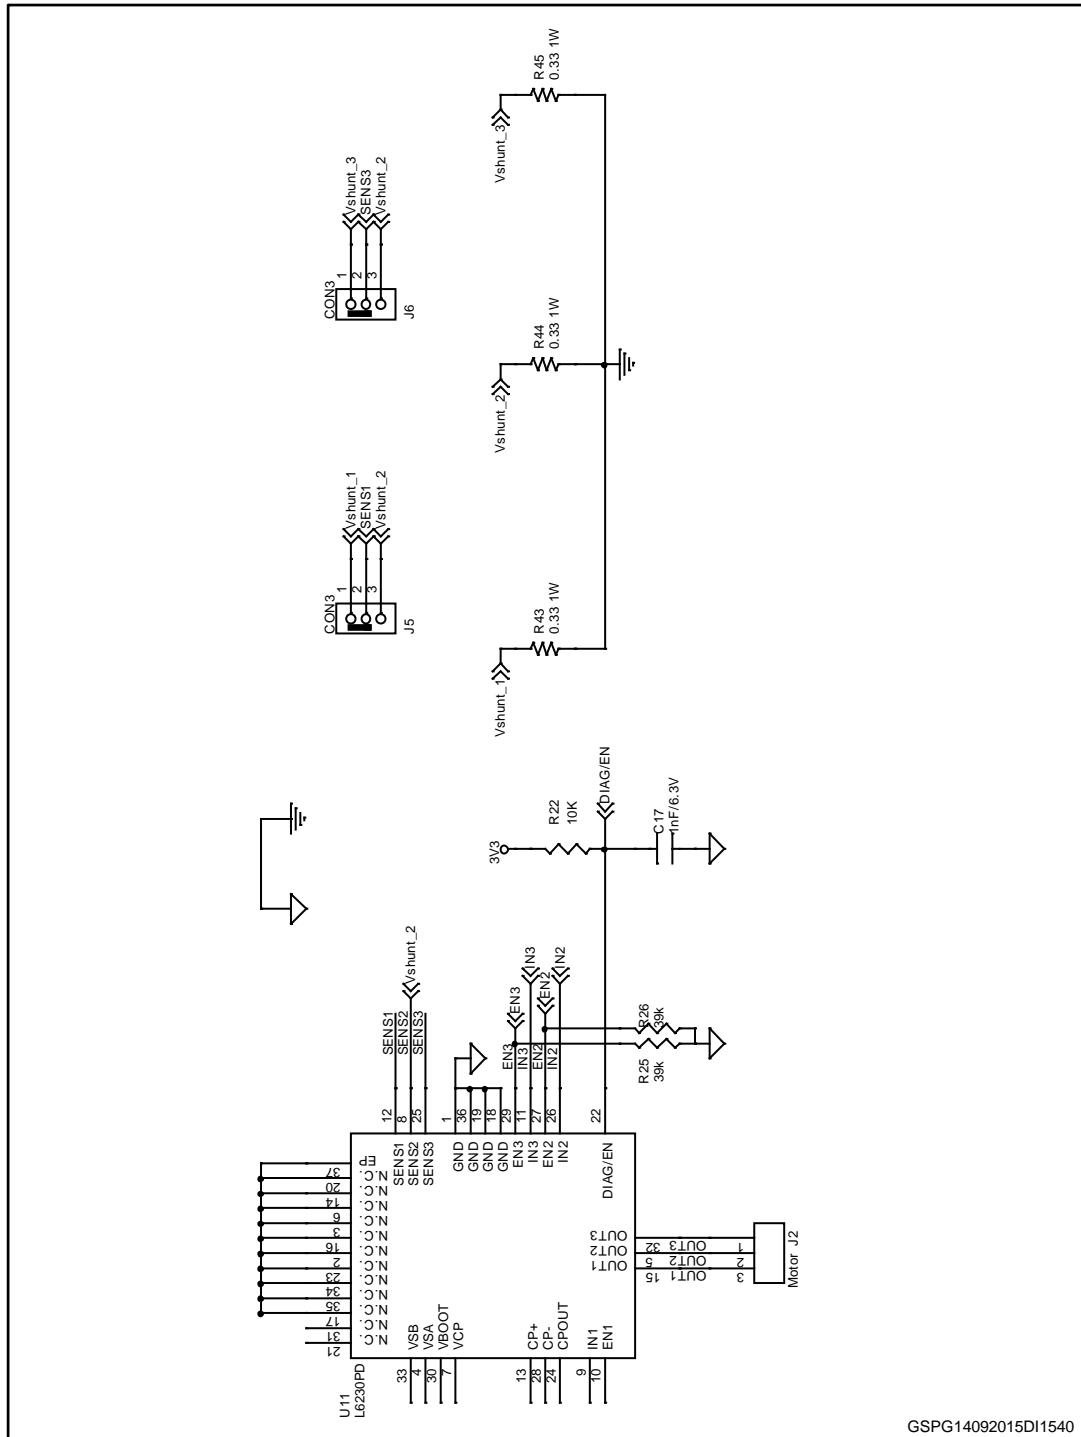

4.2 Power section – Overcurrent detection (OCP) and current sensing measurement

The L6230 driver implements overcurrent protection with an internal detection circuit that does not require an external resistor. The current is compared with an embedded current reference and the output generates a fault condition to the DIAG pin that goes to ground.

This pin, connected to the STM32 Nucleo board (BKIN Timer function), detects this condition and immediately disables the driving signals. The current sensing input is connected to the sensing resistors R_{sense} (refer to the diagram below) and it is possible to choose between three-shunt or single-shunt configuration through the jumpers (J5, J6). For this setting please refer to [Table 1: "Jumper settings"](#).

Figure 15: X-NUCLEO-IHM07M1 – current sensing circuit

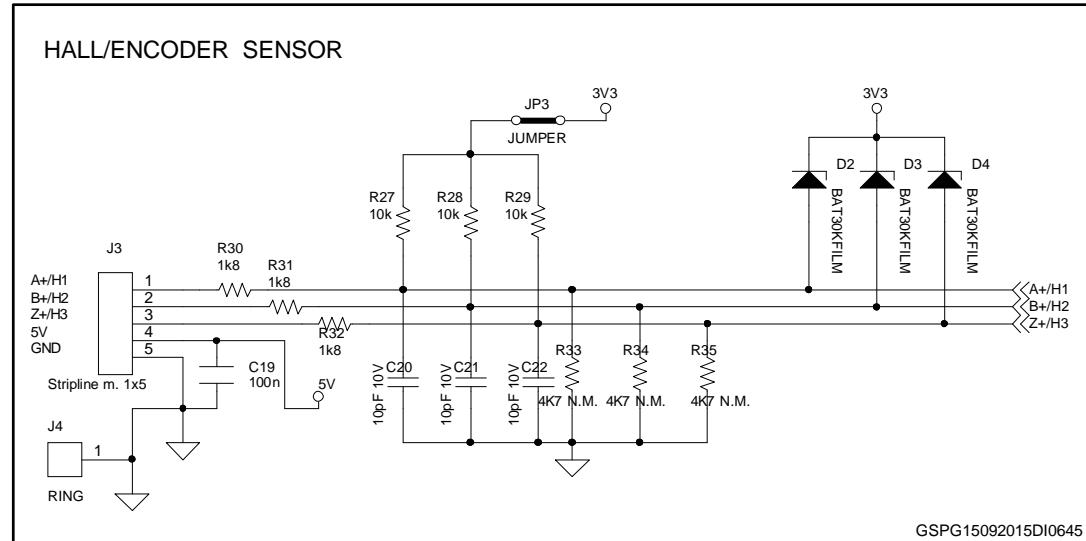

GSPG14092015DI1540

4.3

Analog section – Hall/Encoder motor speed sensor

The X-NUCLEO-IHM07M1 expansion board implements the Hall/Encoder sensor detecting circuit for speed measurement. The motor sensor pin, through the J3 connector and an analog circuit, are connected to the STM32 Nucleo board in order to detect the motor spin; a +5 V and GND are also provided for power supply of the sensors. For sensors that require external pull-up, jumper JP3 is available (see figure below). For this setting please, refer to [Table 1: "Jumper settings"](#).

Figure 16: X-NUCLEO-IHM07M1 – hall/encoder sensor circuit

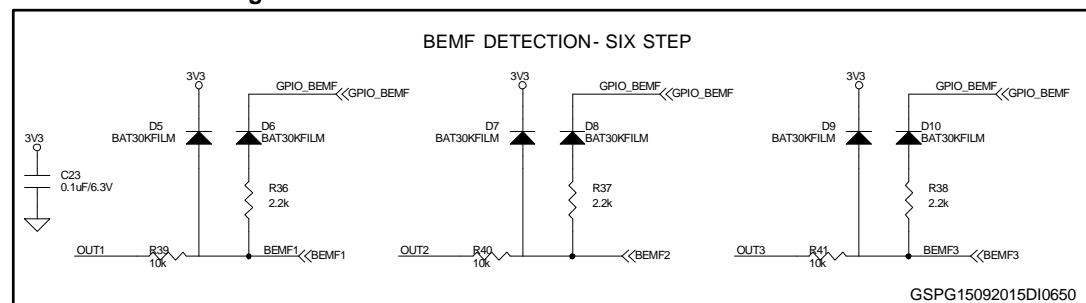

4.4

Analog section – BEMF detection circuit

The X-NUCLEO-IHM07M1 expansion board provides two hardware solutions for motor position measuring, one based on sensors (refer to [Section 4.3: "Analog section – Hall/Encoder motor speed sensor"](#)) and the other based on sensorless detection. In six-step driving mode one of the three phases is left in high impedance state and comparing the voltage of this phase with the center-tap voltage, we can detect the BEMF zero-crossing. This signal is acquired with an analog circuit embedded on the board, as shown in the diagram below.

Figure 17: X-NUCLEO-IHM07M1 – BEMF detection circuit

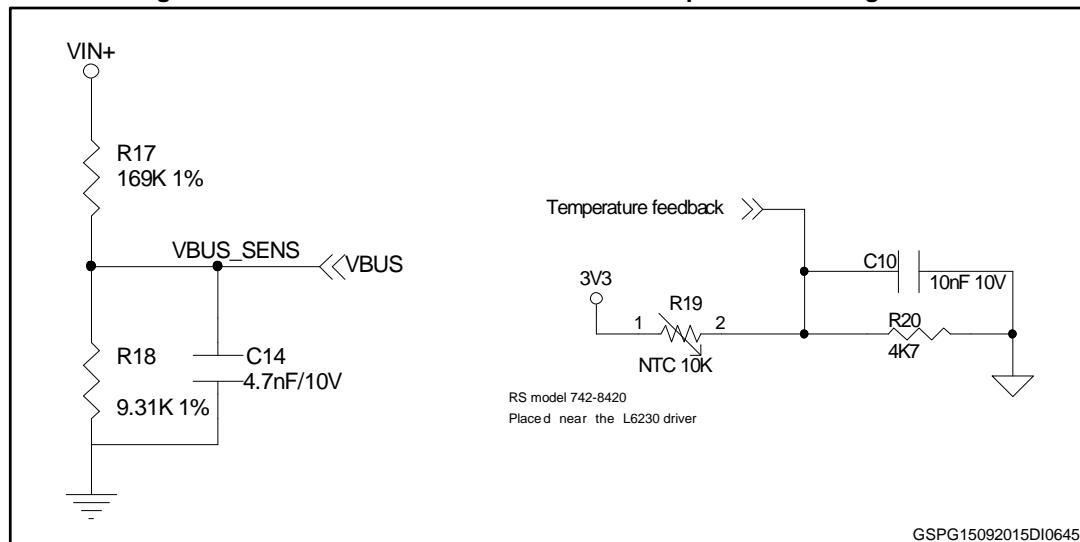

4.5

Analog section – Bus voltage and temperature sensing circuit

The X-NUCLEO-IHM07M1 expansion board provides the hardware for bus voltage sensing and temperature measurement. This signal is acquired respectively with a resistor divider

and with an embedded NTC (placed closed to L6230 driver) as shown in the diagram that follows.

Figure 18: X-NUCLEO-IHM07M1 – VBUS and temperature sensing circuit
